thermal radiative transfer and pdf

Overview. Thermal radiation, also known as heat, is the emission of electromagnetic waves from all matter that has a temperature greater than absolute zero. It represents the conversion of thermal energy into electromagnetic energy. Thermal energy consists of the kinetic energy of random movements of atoms and molecules in matter.

An Atmospheric radiative transfer model, code, or simulator calculates radiative transfer of electromagnetic radiation through a planetary atmosphere, such as the Earth's.

The energy always moves from a warmer system to a colder system. The energy which is moving from one system to another is known as heat. The transfer or dispersion of heat can occur by means of three main mechanisms, conduction, convection and radiation:

where $\hat{\alpha}$ is the thermal expansion coefficient and the other symbols have their usual meanings, defined in the reference. The Prandtl number is simply the ratio of the kinematic viscosity to the thermal diffusivity.

Basic to all of these applications is the fact that heat transfer processes for buildings are usually ill defined, time dependent, multi-dimensional, and in many cases non-linear.

Alumina has high heat resistance and corrosion resistance compared to other ceramics such as silica or mullite. However, for its application to refractory bricks, its high thermal conductivity must be reduced.
